

Criteria	Minimally Acceptable	Satisfactory	Good	Excellent
Technical Fidelity	No significant technical contributions were made, the project is an extension of pre-existing code.	An attempt was made at introducing technical depth, but implementation is lackluster or shallow.	Project demonstrates integration of a technical concept into a design. The design is mostly functional.	Project integrates many technically complex components together into a fully functional project.
Demo / Presentation	Demo is entirely non-functional and/or presentation is confusing or non-existent.	Demo contains significant bugs, presentation is unclear and appears rushed.	Demo is smooth, representative of the work completed. Presentation is clear and well-organized.	Demo is extensible and indefinitely repeatable. Presentation demonstrates depth in the engineering process to the final design.
Idea Originality (Creativity)	Idea is unclear or unoriginal. Many aspects of the idea are absent from the final submission.	Idea is vague and unoriginal. Not all details have been described. Many open-ended questions remain.	Idea is well thought out and convincing. Details of the idea are existent. Idea does not have to be completely original but must have at least a unique component.	Idea is original and described in great detail. Idea is useful in that it solves a problem, provides a service, or enables a significant function.
Feasibility	Not synthesizable at all.	Can synthesize in YoSys without the constraints of a PDK.	Design can be fully synthesized to a PDK, but fails at sizing constraints relative to TT.	Design can be fully synthesized and placed on a Caravel harness for tapeout.
